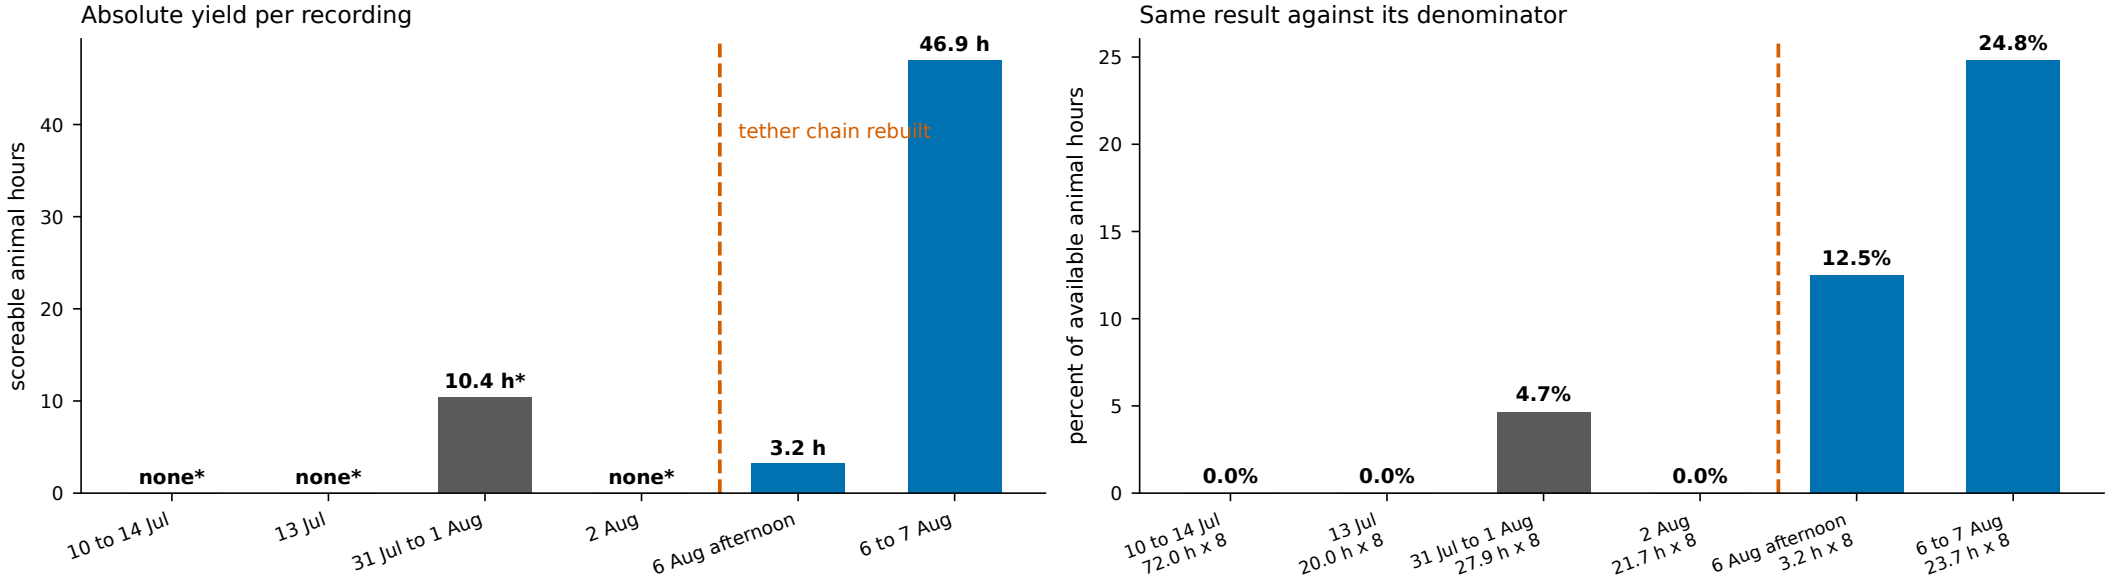

Figure 7. Scoreable animal hours per recording, before and after the tether change

Scoreable means the pipeline gave the animal a SCOREABLE verdict: it passed the quality gate, produced unbroken blocks, and passed a persistence check against a shuffled control. The right panel divides by recording duration times eight positions, because the recordings differ in length and the absolute count on its own is not comparable across them. Values marked with an asterisk come from the vault write ups rather than from pipeline output files, because those older recordings are no longer processed; every unmarked value is computed from the per recording feature files. CAUTION: this compares single recordings, not a controlled series. D2 is the same animal throughout and is the clean comparison. The animal in the B1 position on the right is a replacement, because the original was sacrificed on 5 August after its skull electrode detached.
